

AWS Certified Solutions Architect Professional

Student's Lab Manual

Developed by: Network Expert Inc.

Table of Contents

Lab 1.1: Creating a VPC, IGW, and Updating Your Route Table

Lab 1.2: Creating a Public and Private Subnets for Your VPC and Creating a NAT Gateway

Lab 1.3: Creating a Private Route Table for Your VPC and Creating Security Groups for Your Application

Lab 1.4: Creating an RDS Instance and ELB

Lab 1.5: Creating a Auto Scaling Group for our WebServers

Lab 1.6: Creating A Route 53 Hosted Zone, Alias A Record and Running a Configuration Test

Lab 2.1: Creating an AD Connector

Lab 2.2: Create a Simple AD and Configuring an Instance to join the Simple AD Domain

Lab 2.3: Joining an EC2 Instance to Your on-Prem Domain over AD Connector

Lab 2.4: Exploring Simple AD and Enabling AWS Management Console Access

Lab 4.1: Connecting Your Data Center to VPC via VPN

Lab 5.1: Setting up SNS with S3

Lab 5.2: Setting up Storage GW Service as File Gateway

Lab 5.3: Setting up Storage GW Service as Volume Gateway

Lab 7.1: Create & Deploy Stack using CloudFormation Designer

Lab 7.2: Update Stack using CloudFormation Change Set

Lab 7.3: Creating Template & Deploying using CloudFormer

Lab 7.4: Creating and Deleting Resources Using CloudFormation

Lab 7.5 Cloudformation Potential Errors and Troubleshooting

Lab 7.6: Creating Opsworks stack using cloudformation

Lab 7.7: Deploying Web Application using Opswork

Lab 7.8: Deploying Updating and Upgrading Application

Environment Using Elastic Beanstalk

Lab 9.1: Use Path-Based Routing with Your Application Load Balancer

Lab 9.2: Create an Application Load Balancer Using the AWS CLI

Lab 9.3: Use Microservices as Targets with Your Application Load Balancer

Lab 9.4: Creating and Pushing a Docker Image to Amazon ECR

Lab 9.5: Creating an ECS Cluster, Tasks and Service

Lab 9.6: Creating a Cloudfront Distribution

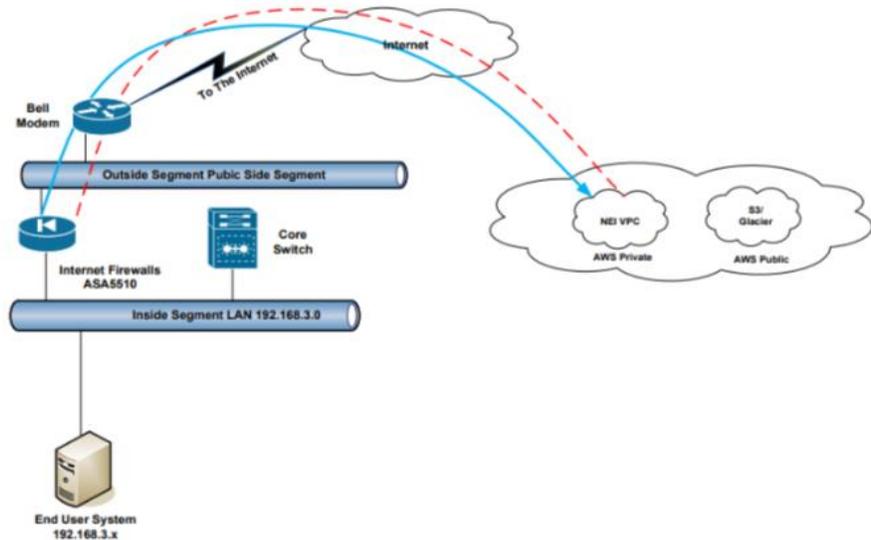

Lab 9.7: Creating an ECS Cluster Powered by AWS Fargate

Lab 10.1: Authenticating Users Using Your On-prem AD with MFA

Lab 10.2: Enable Cross Account Access

Lab 4.1: Connecting Your Data Center to VPC via VPN

1. Go to aws.amazon.com/console/. Login to AWS Management console.
2. Choose any AWS region from the top right of the console.
3. In this exercise we will be creating a VPN tunnel from our Data Center to AWS.

Revision: 1.0
 Last Modified By: Muhammad Saad
 Date Created: 4/7/2018
 Date Modified:
 Department: IT / Network Engineering

Network Expert Inc

DataFlow From Network Expert Inc to AWS Private and Public

4. Look under AWS services, under network and content delivery, choose **VPC**.
5. While at the VPC dashboard, click **create VPC**.
6. For VPC configuration, select the VPC with Public and Private Subnets and Hardware VPN Access.
7. For the top level IPv4 CIDR block you can give **172.20.0.0/16** and give an appropriate VPC name.
8. For the public subnet's IPv4 CIDR block, give **172.20.1.0/24** and for the private subnet's IPv4 CIDR block you can give **172.20.2.0/24**.
9. Leave all other settings and preferences as is. Click **next**.
10. You will be asked for your Customer Gateway IP. This is the IP of your VPN terminating device in your data center. In our case it was the CISCO ASA firewall. Go ahead and check the public IP of your device and paste it here.

11. Give an appropriate Customer Gateway name and VPN Connection name.
12. Change the routing type to static. Under IP prefix give the private subnet of your datacenter.

Step 3: Configure your VPN

Specify the public IP Address of your VPN router (Customer Gateway)

Customer Gateway IP:*

Customer Gateway name:

VPN Connection name:

Note: VPN Connection rates apply.

Specify the routing for the VPN Connection (Help me choose)

Routing Type:*

Specify the IP prefixes for the network on your side of the VPN Connection (e.g. 192.168.0.0/16)

IP Prefix Remove

Add

Cancel and Exit Back **Create VPC**

13. Click **create VPC**. This will take a few minutes.
14. Once your VPC has been successfully created, you can go ahead and scroll down from the navigation panel on the left, navigate to Customer Gateways, Virtual Private Gateways, and VPN connections and see that all these resources have been created for you.
15. Head over to VPN connections from the navigation panel, choose your VPN go to **tunnel details** and you will see that 2 tunnels have been created which are both down.

Create VPN Connection Download Configuration Actions

Filter by tags and attributes or search by keyword

Name	VPN ID	State	Virtual Private Gateway	Customer Gateway	Custom
NEI VPN	vpn-fb3aeec	available	vgw-8e55dcbe	cgw-e974fcd9 NEI CGW	70.51.25

VPN Connection: vpn-fb3aeec

Details **Tunnel Details** Static Routes Tags

Outside IP Address	Inside IP CIDR	Status	Status Last Changed	Details
35.182.154.178	169.254.62.148/30	DOWN	July 4, 2018 at 7:23:33 PM UTC-4	-
35.183.56.112	169.254.62.44/30	DOWN	July 4, 2018 at 7:23:28 PM UTC-4	-

16. Now go ahead and click **download configuration**.
17. This is the configuration that you need to implement on your VPN terminating device so ensure you choose the appropriate Vendor, Platform and Software.
18. In our case our VPN terminating device was a CISCO Systems ASA 5500 series firewall. Once you have chosen the appropriate settings, click **download** and open the configuration with wordpad or microsoft word.
19. The configuration is lengthy as it has lots of extra information, you can read through the configuration copy the necessary parts into a text document and make the necessary edits. Below is a sample shortened and edited configuration for CISCO ASA firewall.

```
!ACL defining interesting traffic

exit
tunnel-group 52.60.237.251 general-attributes
default-group-policy filter
Exit
```

21. Once you have edited the configuration go ahead and implement it on your VPN device. Once the configuration has been successfully implemented check the status of the tunnels. At least one tunnel should be up. You may also check the status of tunnels using the AWS console by navigating to the VPC console and then navigating to VPN connections. Choose your VPN and go to **tunnel details**.

The screenshot shows the AWS VPC console interface. At the top, there are buttons for 'Create VPN Connection', 'Download Configuration', and 'Actions'. Below this is a search bar and a table of VPN connections. The table has columns for Name, VPN ID, State, Virtual Private Gateway, Customer Gateway, and Customer Gateway ID. One connection is listed: 'NEI VPN' with VPN ID 'vpn-fb3aeec', State 'available', VPG 'vgw-8e55dcbe', and Customer Gateway 'cgw-e974fcd9 | NEI CGW'. Below the table, the 'Tunnel Details' tab is selected, showing a table of tunnels. The tunnel table has columns for Outside IP Address, Inside IP CIDR, Status, Status Last Changed, and Details. Two tunnels are listed: one with Outside IP 35.182.154.178 and Inside IP CIDR 169.254.62.148/30, which is 'UP' as of July 4, 2018 at 7:45:17 PM UTC-4; and another with Outside IP 35.183.56.112 and Inside IP CIDR 169.254.62.44/30, which is 'DOWN' as of July 4, 2018 at 7:23:28 PM UTC-4.

Name	VPN ID	State	Virtual Private Gateway	Customer Gateway	Customer Gateway ID
NEI VPN	vpn-fb3aeec	available	vgw-8e55dcbe	cgw-e974fcd9 NEI CGW	70.51.251.1

Outside IP Address	Inside IP CIDR	Status	Status Last Changed	Details
35.182.154.178	169.254.62.148/30	UP	July 4, 2018 at 7:45:17 PM UTC-4	-
35.183.56.112	169.254.62.44/30	DOWN	July 4, 2018 at 7:23:28 PM UTC-4	-

22. Once you have confirmed that at least one tunnel is up, navigate to route tables from the left navigation panel. Choose the route table that is associated with your VPC and is **not the main route table**. Go to **subnet association** and ensure this route table is associated with the public subnet. Go to routes and ensure that the the default route is pointing to the igw (internet gateway). Click **edit**, click **add another rule**. For destination put in the private subnet of your datacenter and for the target choose your vgw. Click **save**. Click on the name blank and name it **Public Subnet RT**.

Create Route Table Delete Route Table Set As Main Table

Search Route Tables and their X

Name	Route Table ID	Explicitly Associat	Main	VPC
<input checked="" type="checkbox"/>	rtb-7cee9914	1 Subnet	No	vpc-30008558 NEI VPC
<input type="checkbox"/>	rtb-4b335422	0 Subnets	Yes	vpc-87b422ee Default (Don't ...
<input type="checkbox"/>	rtb-4ee9826	0 Subnets	Yes	vpc-30008558 NEI VPC

Summary Routes Subnet Associations Route Propagation Tags

Edit

Subnet	IPv4 CIDR	IPv6 CIDR
subnet-b2d261da Public subnet	172.20.1.0/24	-

23. Click create new route table and name it **Private Subnet RT** and ensure you choose the right VPC.
24. Once the table has been created, choose it and go to subnet associations from the tabs at the bottom of the page. Click **edit** and choose your private subnet and then click **save**. Navigate to the routes tab and click **edit**, click **add another rule**. For destination put in the private subnet of your datacenter and for the target choose your vgw. Click **save**.
25. Launch a linux instance in the private subnet of your VPC. Ensure you allow all traffic to the instance when assigning it a security group so you don't encounter any problems.
26. Once the instance has launched, copy it's private IP address and ping it using command prompt. Make sure your private IP address is within the

private subnet of your data center.

```
Connection-specific DNS Suffix . :

Approximate round trip times in milli-seconds:  
    Minimum = 26ms, Maximum = 33ms, Average = 28ms
```

27. A successful ping means you are successfully able to reach AWS over your VPN tunnel.

28. Go ahead and connect to your instance using putty. Once again you have connected to your private AWS infrastructure over your VPN tunnel.

29. Head back to the VPC console, head to VPN connections and make sure that your tunnel is up. You have successfully set up a VPN connection between your on prem data center and AWS.
